Damxey

Ayodamope Medupin

Software Engineer · Full-Stack, Security & Systems

I build software across the whole stack (web interfaces, APIs, databases and machine-learning pipelines) and I run the infrastructure it lives on. My work spans production workforce systems, security platforms and research, with security and reliability designed in from the start rather than bolted on.

HG Attendance System

Attendance, scheduling, leave and reporting platform for a guard workforce

Role: Sole developer & operator

An internal attendance, scheduling, leave, and reporting system built for Hogan Guards' on-the-ground security workforce. Built to run in production on a self-hosted Docker stack, with an offline-capable kiosk for clock-in/out.

- Offline-first PWA kiosk (installable service worker) for staff clock-in/out at guard posts with unreliable connectivity
- Automatic supersession of stale open sessions, overnight-shift handling, and grace-window scan pairing to keep attendance data accurate without manual correction
- Staff photos are served only through short-lived signed URLs, never public storage, to protect personal data
- Built-in billing: Paystack-powered subscription payments, auto-renewal, receipts, and payment history
- Proactive system-health email alerts, automated log/image pruning, and encrypted external-drive backups
- Deployed two ways: on-premises via Docker/Nginx with internal-CA HTTPS over ZeroTier, or on an Oracle Cloud Always Free tier for remote offices
- Super-admin recovery flow with session revocation, designed so a forgotten password can never lock the whole org out

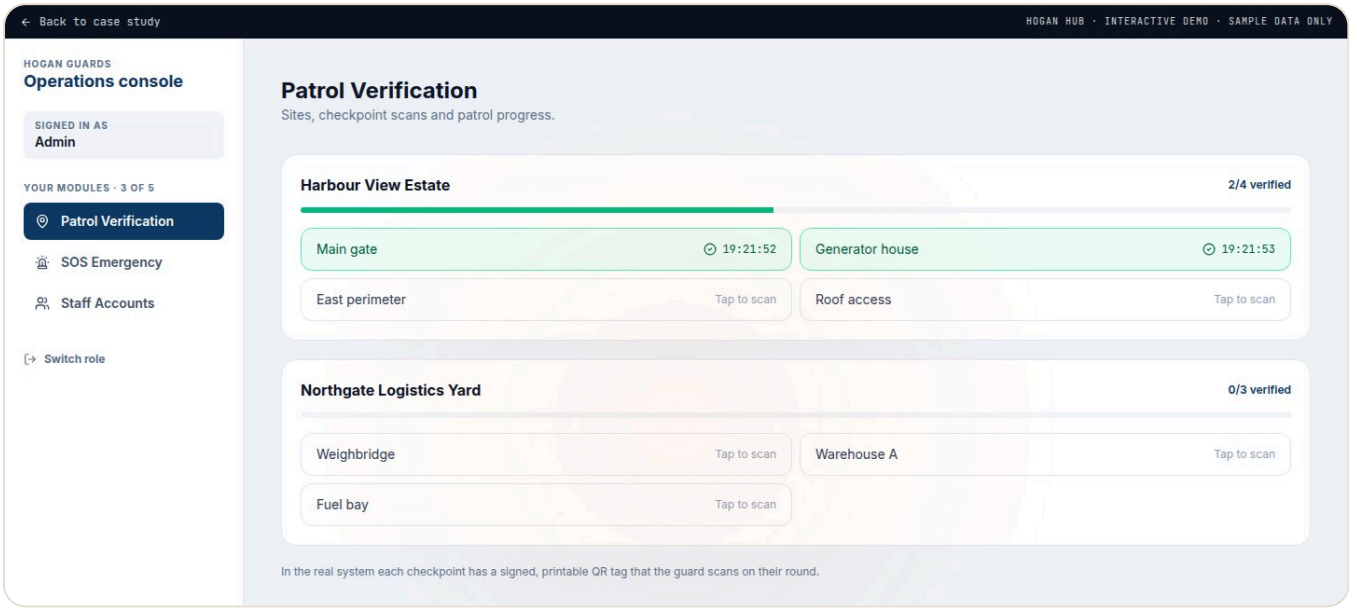

Laravel 12 | React 19 | MySQL 8.4 | Docker | Nginx | PHP-FPM | TypeORM

The source code for this project is private. Case study and screens here; an interactive demo on sample data is available on request.

02 · FULL-STACK · INTERNAL PLATFORM · 2026

Hogan Hub

Internal operations platform for a guard company: patrol verification, SOS alerts and staff accounts

Role: Sole developer

Hogan Guards' internal operations platform: patrol verification at client sites, SOS alerts, staff accounts, asset records and an encrypted password vault. One organisation, with access decided by role.

- A strict role hierarchy: higher roles manage lower ones, nobody manages a peer or themselves, and deactivating an account or changing its role takes effect on its very next request
- Patrol verification: client sites with schedules and assigned guards, and checkpoints with signed, printable QR tags that guards scan on their round
- SOS alerts with GPS location, a hold-to-send button so a stray tap cannot fire one, and a response workflow with a timeline
- A per-user password vault with AES-256-GCM encrypted credentials, and staff accounts created with memorable generated passwords
- System governance for the Super Admin: maintenance mode, sign everyone out, background jobs and an AI security audit that runs server-side only
- Security logs of sign-in activity with CSV export
- NestJS 11 and TypeORM on the back end (SQLite in development, Postgres in production), React 19, Vite and Tailwind on the front end, sharing its look with the HG Attendance System

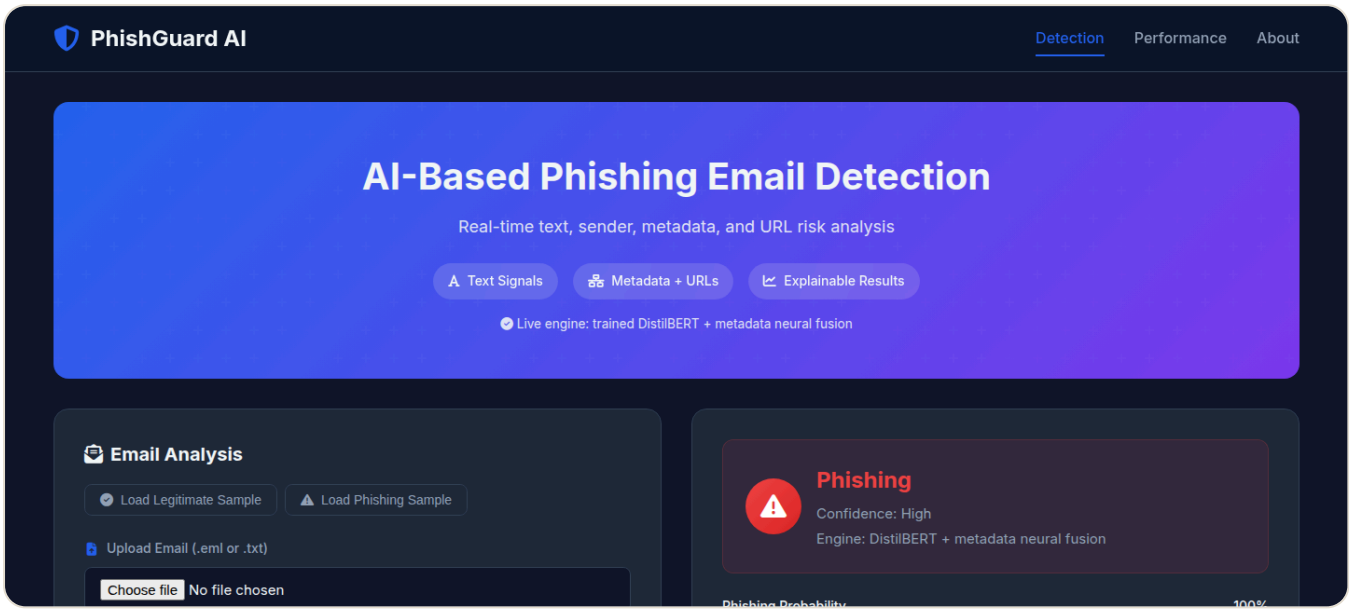

React 19 · TypeScript · Tailwind CSS · NestJS 11 · TypeORM · SQLite / Postgres · JWT · Gemini API

03 · MACHINE LEARNING · SECURITY · 2026

PhishGuard AI

Multimodal deep-learning system for real-time phishing detection

Role: Sole developer & researcher

A runnable multimodal deep-learning system that combines DistilBERT email-text embeddings with a metadata neural network and late fusion, served through a Flask dashboard with real-time predictions and explainability.

- 98.26% accuracy / 99.75% ROC-AUC on a held-out 460-email test set (3,065-row stratified split, seed 42). Fully reproducible and documented in a model card
- Frozen DistilBERT text encoder fused with a 15-feature sender/receiver/message/URL metadata branch via a late-fusion classifier
- Kernel SHAP explanations for metadata attribution, plus DistilBERT final-layer attention visualization, so the tool shows why it flagged an email, not just that it did
- .eml / .txt import for real-world email analysis
- Automatic heuristic fallback if model artifacts are unavailable, so the app degrades gracefully rather than failing

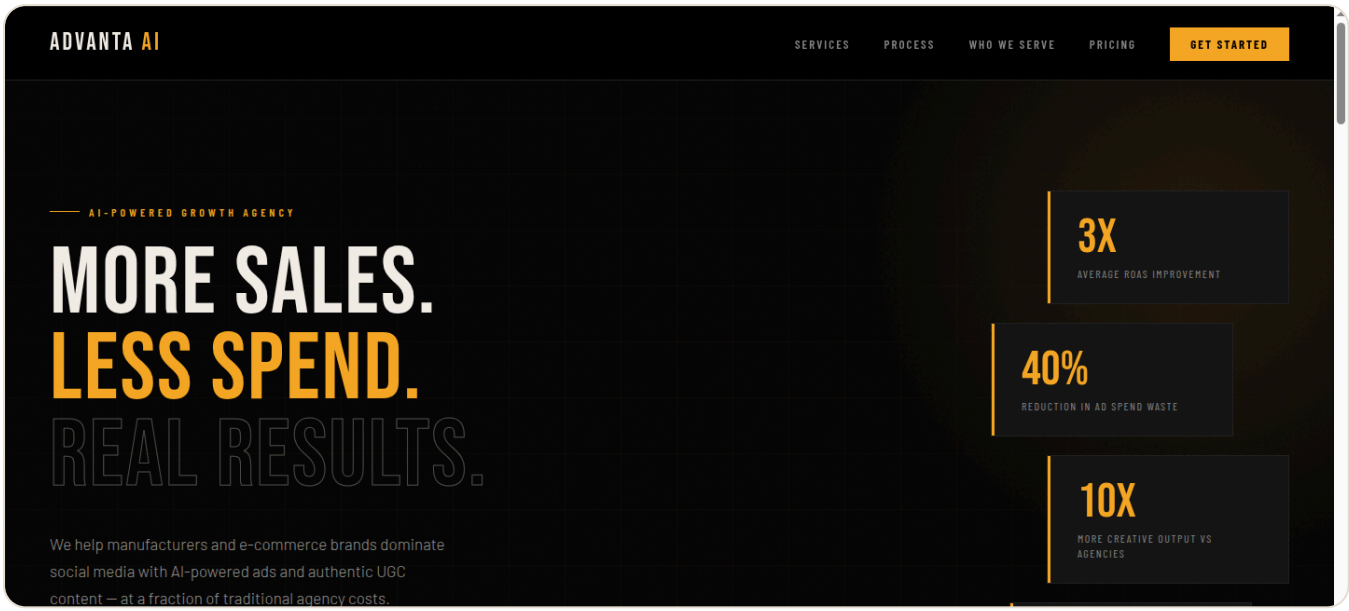

Python | Flask | PyTorch | DistilBERT | SHAP | Transformers

Code: github.com/d4mz3y/phishing-detection-app

04 · FRONTEND · MARKETING SITE · 2026

AdVanta AI

Marketing site for an AI-powered growth/agency product

Role: Frontend developer

A full marketing site for an AI-driven growth product: hero, problem framing, services, process, audience segmentation, pricing, and conversion sections, built as independent, composable React components.

- Eleven-section one-page structure (Hero, Ticker, Problem, Services, Process, Who We Serve, AI Edge, Pricing, CTA) built as isolated, reusable components
- Scroll-reveal animation component shared across sections for a consistent motion language
- Production-instrumented with Vercel Analytics and Speed Insights from day one

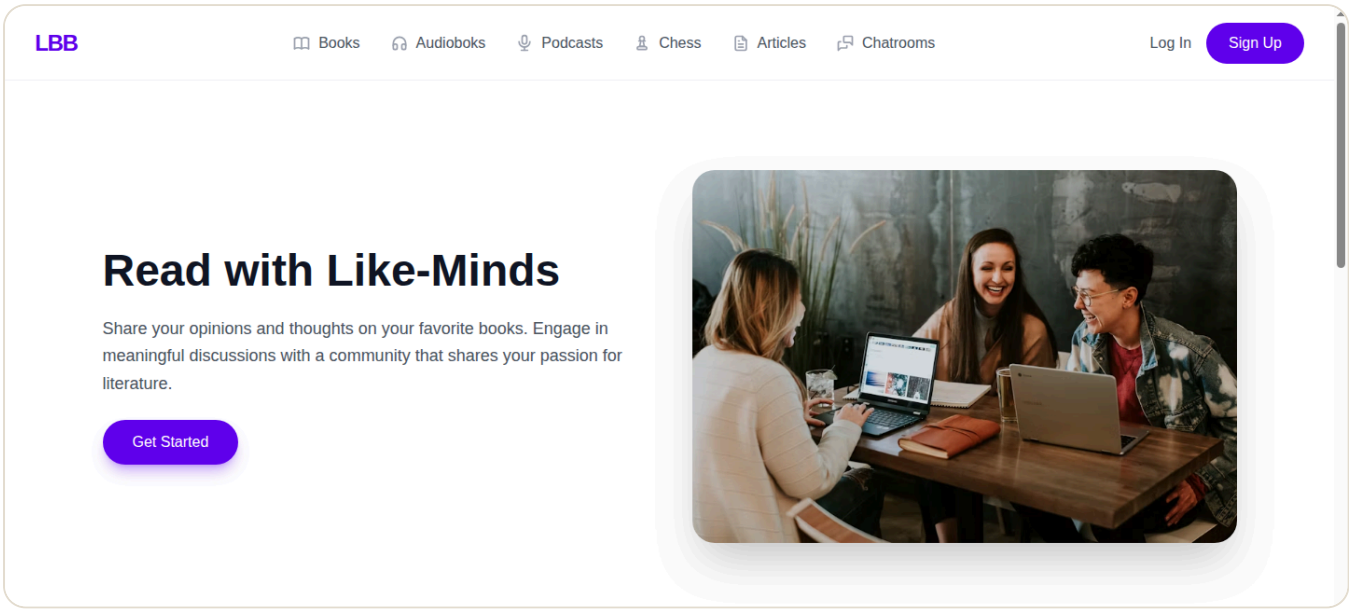

React · Vite · Vercel Analytics · Speed Insights

05 · FULL-STACK · VUE / NUXT · 2026

LeadByBooks

A social reading platform: books, audiobooks, podcasts & community

Role: Sole developer

An ambitious digital-library concept that goes beyond a book catalog: books, audiobooks, podcasts, live chatrooms, even a chess page, backed by a Prisma-modeled database and built on Nuxt 3.

- Thirteen distinct pages, including dashboard, books, audiobooks, podcasts, chatrooms, articles, interests, and auth flows
- Prisma schema-driven data layer, shared layout and navbar/footer components across the app
- TailwindCSS design system configured from scratch for the project

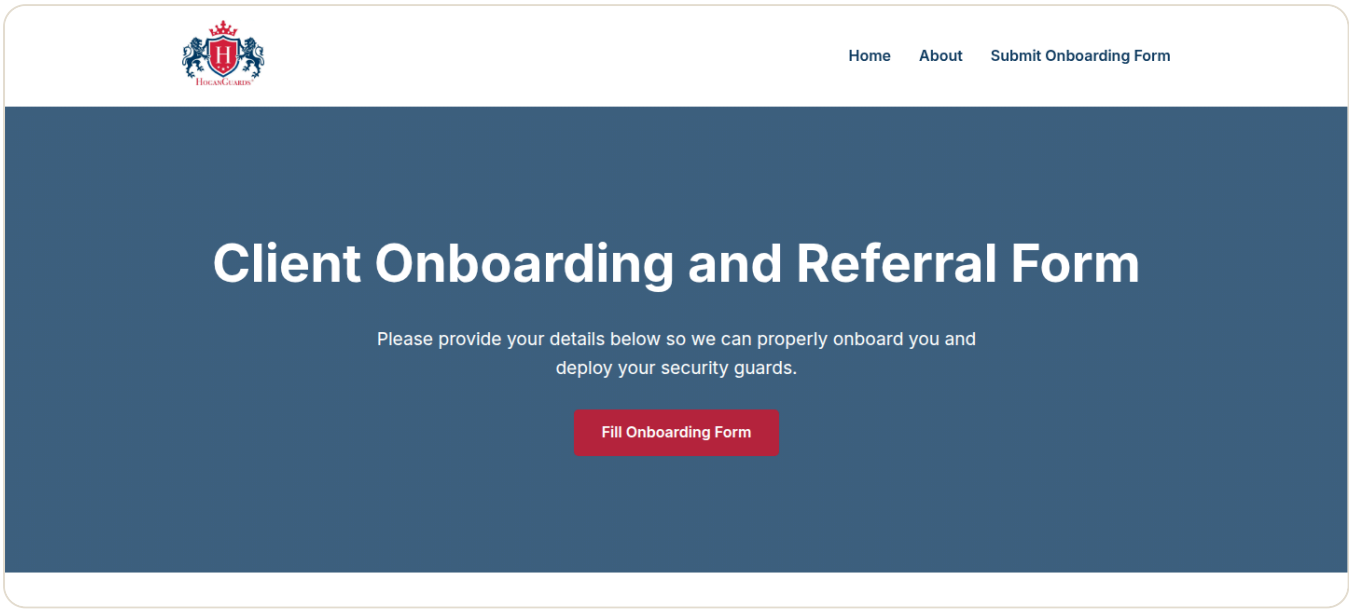

Nuxt 3 · Vue · Prisma · TailwindCSS · TypeScript

Live: d4mz3y.github.io/Library-Project · Code: github.com/d4mz3y/Library-Project

06 · FULL-STACK · INTERNAL TOOL · 2026

Client Onboarding & Referral Portal

Digitized KYC/onboarding workflow replacing a paper form

Role: Sole developer

Replaces the paper Know-Your-Client form used when onboarding a new client for guard deployment, with real-time validation, automated email notifications, and an admin dashboard to review submissions.

- Client details, deployment specifics, and attribution tracking (advert / website / referral / social, with a conditional referrer field)
- Automated HTML email summary to admins plus a confirmation email to the client on every submission, via Nodemailer/SMTP
- Authenticated admin dashboard for reviewing and managing submissions
- Dockerized with an Nginx deploy config for self-hosting

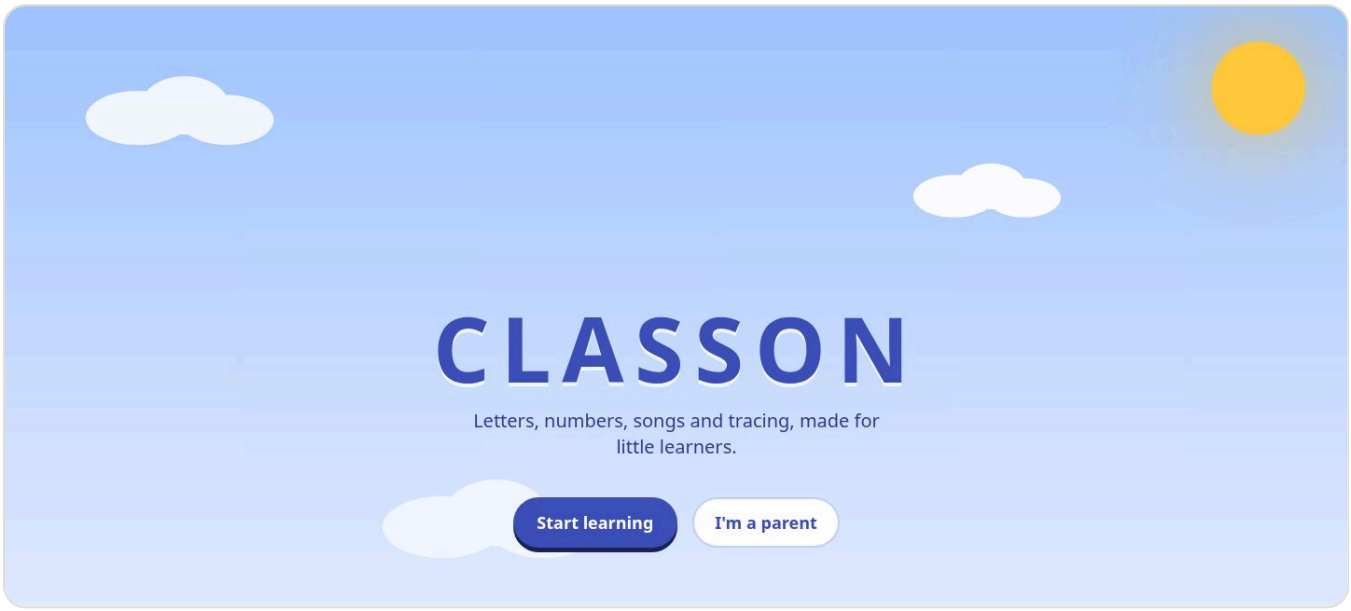

Node.js · Express · MongoDB · Nodemailer · Docker

07 · PRODUCT DESIGN · FRONTEND · 2026

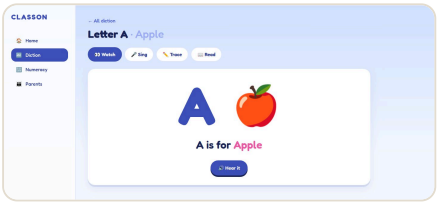

Classon

A learning platform for young children: letters, numbers, songs, tracing and a parents' view

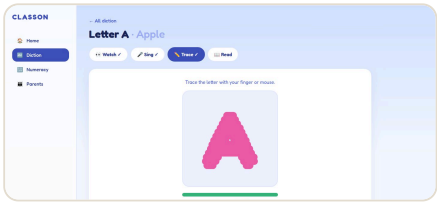

Subject dashboard with progress rings

Watch: animated letter with a spoken word

Trace: strokes are checked against the letter

Role: Designer and frontend developer

An early-learning product for young children. Kids sign in with their own account, work through lessons by letter and number, and parents get a separate dashboard to follow progress. Shown here as the Figma product design and as a working React app.

- All 26 letters, each with four activities: an animated Watch scene with a spoken word, a Sing-along with a tune generated in code, a Trace canvas, and a page-turning Read flip-book
- Numbers 1 to 10 with a tap-to-count activity and a quiz
- Lessons unlock one after another, and a direct link to a locked lesson sends you back
- Tracing is measured, not faked: it checks how much of the letter your strokes cover and how much of the drawing stays on it, so scribbling or a single dot does not pass
- A parents' view that counts letters, numbers and activities finished and shows a calendar of active days, all from real in-app activity
- The Figma file covers the wider product: sign-up and sign-in for children, parents and admins, the child dashboard, videos, books, songs, worksheets, reports, tests and a marketing site
- No third-party media in the app: pictures are emoji and SVG, speech uses the browser's own voices, and the songs are synthesised with the Web Audio API

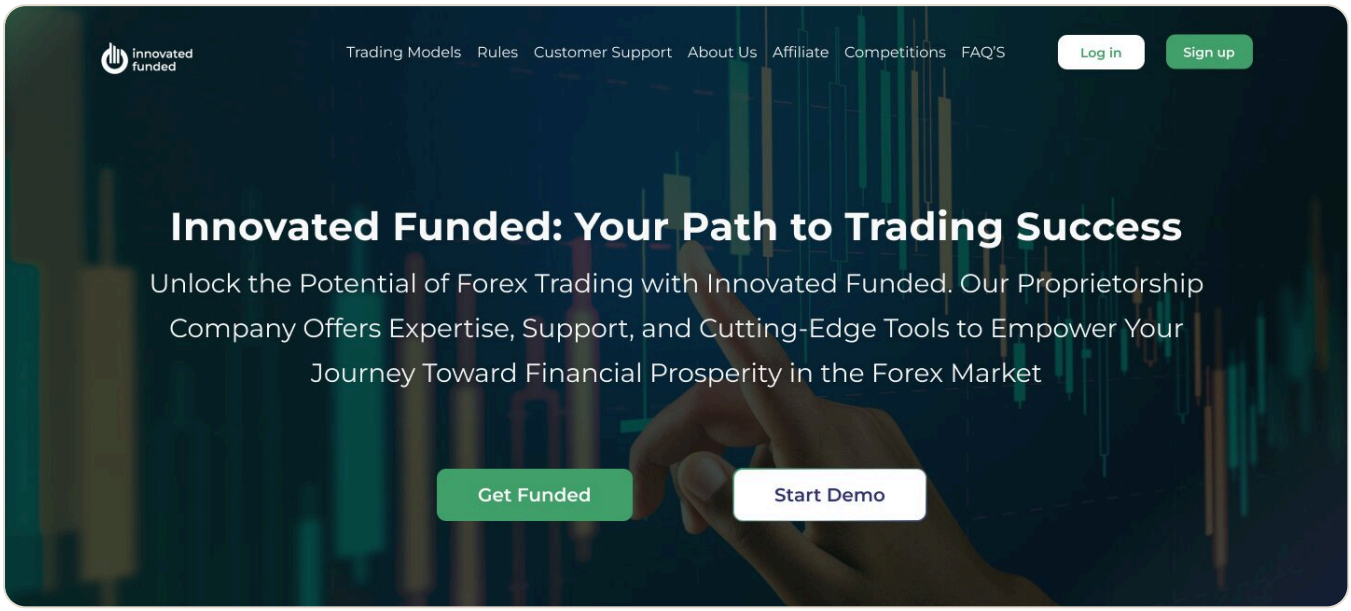

Figma · React 19 · Tailwind CSS · Framer Motion · Vite · Web Audio API

08 · PRODUCT DESIGN · FRONTEND · 2023

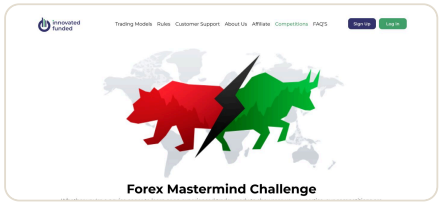

Innovated Funded

Website and sign-up flow for a forex proprietary-trading platform

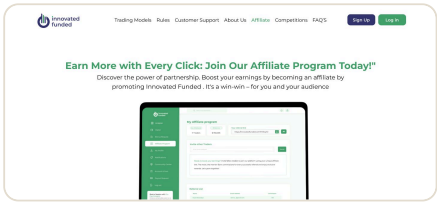

Trading models: Evaluation, Lite and Pro

Competition flow

Affiliate programme

Role: Designer and frontend contributor

The website for Innovated Funded, a forex proprietary-trading company where traders take an evaluation to get funded. Designed in Figma and built as a small team, covering the public site, the account flow and the content pages a trading product needs.

- A marketing landing page and a waiting-list version, with a clear path from “Get funded” to account creation
- Membership tiers shown as Evaluation, Lite and Pro, each with its own trading-model and rules page
- A trading competition flow, plus an affiliate programme page
- Account creation and sign-in screens, including the error states for a wrong email or password
- The supporting pages: about, customer support, FAQ, risk disclosure, privacy policy and cookies policy
- Built front-end pages in Vue-style templating and Tailwind CSS, with the brand colours defined once in the Tailwind config

Figma | Vue.js | Tailwind CSS | HTML5

The source code for this project is private. Case study and design screens only.

Skills

Frontend

React.js · Vue.js · Nuxt.js · Tailwind CSS · TypeScript · JavaScript · HTML · CSS · SCSS

Backend

Node.js · PHP · SQL · ORM tools · RESTful APIs · Authentication (JWT, role-based access)

Systems & tools

Git · Figma · Linux System Administration · Deployment & Configuration Support · Enterprise IT Support

Experience

Hogan Tech · Hogan Hub

Internal modular platform for managing users, permissions, and operational access.

React · Tailwind CSS · Node.js · System Security

Innovated Funded · Fintech Infrastructure

Responsive investment platform and fintech landing page infrastructure.

Vue.js · Nuxt.js · Tailwind CSS · TypeScript

Classon Education · LMS Portal

Comprehensive E-learning platform with interactive course modules.

React · Framer Motion · Tailwind CSS · Design Systems

The Redeemed School · Missions Info System

Full-stack administrative portal for student and institutional management.

Node.js · SQL · PHP · Bootstrap

Every project above with public code is on github.com/d4mz3y. Full CV available on request.
